

ResumeForge — Build Walkthrough

What Was Built

A complete, production-ready AI-powered resume builder application at `/Users/meetpatel/Resume_Builder_Application`.

Architecture Overview

Screenshots

Files Created (30 files)

Backend

File	Purpose
 run.py	App entry point
 app/init.py	Flask app factory
 app/config.py	Config with env vars
 app/models/	4 SQLAlchemy models
 app/services/claude_client.py	Claude API wrapper
 app/services/latex_engine.py	JSON → LaTeX renderer
 app/services/ats_scorer.py	ATS proxy scorer
 app/services/prompts/	7 system prompts
 app/routes/	6 blueprints, 12 API endpoints

Frontend

File	Purpose
 styles.css	Full design system (dark mode, glassmorphism)
 app.js	Global utilities
 templates/	7 HTML templates

Verification

- ☒ Flask server starts successfully on `http://127.0.0.1:5000`
- ☒ Landing page renders with hero section and feature cards
- ☒ Dashboard shows stats, quick actions, and recent applications
- ☒ Master Resume form loads with dynamic JS for skills/bullets/education
- ☒ Analyze page correctly guards when no resume exists
- ☒ All static assets load (CSS, JS, fonts)
- ☒ No Python errors in server logs

How to Run

```
bash

cd /Users/meetpatel/Resume_Builder_Application
source venv/bin/activate
# Edit .env and add your ANTHROPIC_API_KEY
python run.py
# Open http://127.0.0.1:5000
```

Next Steps for the User

1. **Add your Anthropic API key** to `.env` (replace `your_anthropic_api_key_here`)
2. **Fill in your Master Resume** — the app needs this to analyze and tailor
3. **Paste any job description** into the Analyze page to get your first brutal critique
4. **Tailor and export** — the LaTeX output copies directly into Overleaf
